GUIDE

Can I take my mobility scooter on a plane?

Usually only if its battery is under 300Wh and it folds small enough, and even then the airline can still refuse it.

July 28, 2026 · 4 minute read

The short answer

Usually yes. Mobility scooters are carried by most airlines on most routes, and in the UK, Europe and the United States they travel free of charge, in addition to your normal baggage allowance. Your scooter is treated as a mobility aid, not as luggage.

The honest caveat is that "usually yes" is doing real work in that sentence. Whether your particular scooter goes on your particular flight comes down to two things: the battery inside it, and whether it physically fits in the hold of that aircraft. Both are worth settling weeks before you travel, not at the check in desk.

The battery decides most of it

Airlines care about batteries because they are governed by dangerous goods rules, not by customer service policy. Nobody at the airline can make an exception for you, however reasonable your request.

Broadly, there are three kinds of battery in mobility scooters:

- **Sealed lead acid, gel or AGM.** The traditional type. Non spillable and generally the least trouble, though the scooter itself is heavier. Batteries normally stay fitted, and the airline will want the scooter made safe against accidental activation.
- **Wet cell, or spillable.** Rare in modern scooters. These attract the strictest handling and some airlines will not take them at all.
- **Lithium-ion.** What almost every lightweight folding travel scooter uses. The battery normally has to be removed and carried in the cabin with you, with the terminals protected so nothing can short across them.

For lithium batteries, the number that matters is the watt hour rating, written on the battery label as Wh. Airlines compare that figure against a threshold set by international dangerous goods guidance, commonly 300 Wh for a single battery carried for a mobility aid, with different allowances for spares. Do not assume your battery is under it, and do not assume a battery sold as "airline friendly" has been checked for your airline. Read the label, then get the airline to confirm in writing against that exact figure.

Size, weight and the aircraft

No mobility scooter travels in the cabin. It goes in the hold, which means the limiting factor is often the aircraft rather than the airline. A large long haul aircraft has a wide cargo door and containerised holds. A small regional turboprop on a domestic hop may have a narrow hatch and a strict weight limit for anything loaded by hand, so the same scooter that flew out may not fly back on a different aircraft type.

This is why you check the route, not just the carrier. Ask about the specific aircraft on each leg, including connections, and ask whether the scooter can be gate checked so you keep it right up to the aircraft door and get it back on the airbridge.

When buying a new scooter will not fix this

It is worth saying plainly: if your difficulty is the airport rather than the destination, a new scooter is the wrong purchase.

Airports are long. The walk from check in to a far gate, then the stand and wait at passport control, is the part that exhausts most people, and it is precisely the part a scooter in the hold cannot help with. Airport special assistance covers exactly that, is free, and is a legal obligation

on the airport rather than a favor. Book it with the airline at least 48 hours before departure and someone meets you, moves you through the terminal and takes you to the gate.

So if you fly twice a year and manage well at home, the sensible answer may be to travel without a scooter, use assistance in the airport, and rent at the destination. Many vacation destinations have local rental companies, and hiring avoids the real risk of hold travel, which is damage. Mobility aids are handled by baggage systems that were not designed for them, and a scooter that comes off the aircraft broken leaves you stranded in a way a suitcase never does. If you buy a travel scooter, buy it because it improves the other 360 days of your year. The flights are a constraint to work around, not the reason.

What to measure, and what to ask

Before you contact the airline, write down, from the scooter and its battery label rather than from the brochure:

- Battery chemistry, and the watt hour rating printed on the battery itself
- Whether the battery is removable without tools, and how
- Total weight of the scooter, and the weight of the heaviest single piece once dismantled
- Folded dimensions: length, width and height
- How the scooter is switched off and immobilized

Then ask the airline, and ask for the answers by email:

- Is this battery accepted on every leg of this booking
- What is the aircraft type on each leg, and does the scooter fit that hold
- Must the battery travel in the cabin, and how must the terminals be protected
- Can I keep the scooter to the aircraft door and collect it there
- What is the process and the liability if it arrives damaged

Take printed copies of both lists with you. The confirmation in your hand is what settles a disagreement at the desk.

General information, not medical advice. If fit, posture, pressure relief or fall risk is part of your decision, speak to an occupational therapist.
